ENVIRONMENTAL MANAGEMENT

0680/22

Paper 2 Management in context

October/November 2019

1 hour 45 minutes

Candidates answer on the Question Paper.

No Additional Materials are required.

READ THESE INSTRUCTIONS FIRST

Write your centre number, candidate number and name in the spaces at the top of this page.

Write in dark blue or black pen.

You may use an HB pencil for any diagrams, graphs or rough working.

Do not use staples, paper clips, glue or correction fluid.

DO NOT WRITE IN ANY BARCODES.

Answer all questions.

Electronic calculators may be used.

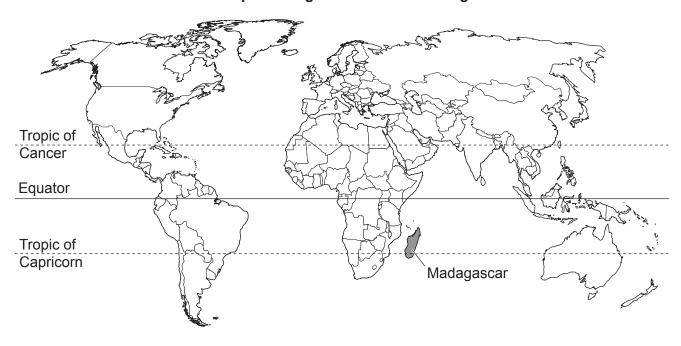

You may lose marks if you do not show your working or if you do not use appropriate units.

At the end of the examination, fasten all your work securely together.

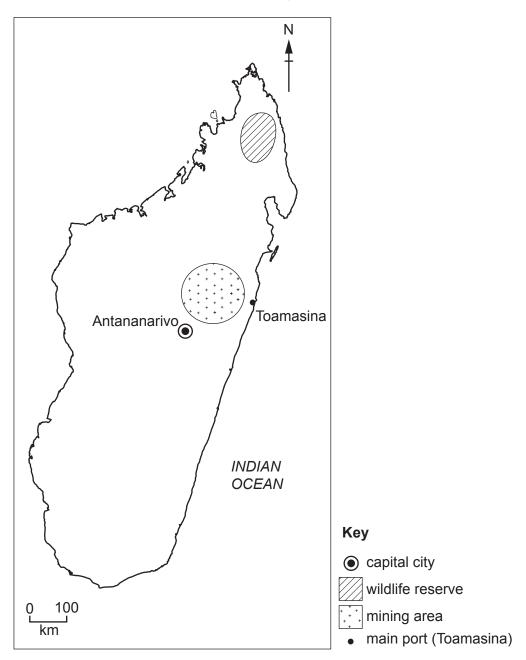

The number of marks is given in brackets [] at the end of each question or part question.

This document consists of 21 printed pages and 3 blank pages.

world map showing the location of Madagascar

map of Madagascar

Area of Madagascar: 587 041 km²

Population: 25.6 million (in 2017)

Children per woman: 4.12

Life expectancy: 65.9 years

Currency: Malagasy ariary (2940 MGA = 1 USD)

Languages: French, Malagasy, English

Climate of Madagascar: tropical along the coast, temperate inland, very little rain (arid) in the south

Terrain of Madagascar: narrow coastal plains and mountains inland

Main exports of Madagascar: agricultural products (coffee, lychees, vanilla and sugar), chromite, petroleum products and textiles

Madagascar is the fourth largest island in the world. In 2017, 60% of the population lived in rural areas. Agriculture is the main economic activity. Mining and oil exploration are a developing part of the economy. The island has a high biodiversity including many endemic species, which are species found nowhere else in the world. There is great potential for sustainable tourism. Madagascar has very few roads and many people have a low standard of living.

(a) (i)	Calculate the number of people living in rural areas in Madagascar in 2017.
	[1]
(ii)	Suggest two reasons why most people living in rural areas in Madagascar do not think they will benefit from the development of sustainable tourism.
	1
	2
	[2]
(iii)	As many as 300 000 tourists visit Madagascar each year.
	Suggest three services that are needed by tourists.
	1
	2
	3
	[3]
(iv)	Suggest two environmental problems that can be caused by large numbers of tourists.
	1
	2
	[2]

(b) Many tourists visit Madagascar to see the wildlife.

The photograph shows two lemurs. Lemurs are an endemic species in Madagascar.

Madagascar has 101 different species of lemur. Each species is adapted to a particular habitat.

(i)	A recent survey of Madagascar found that 42 species of lemur are at risk of extinction.
	Calculate the percentage of lemur species that are not at risk of extinction.

	% [2
(ii)	Define the term habitat.
	[1

(iii)	The habitat o	f many species	of lemu	r ha	s beer	redu	ced in recent y	ears by defo	orestation.
	Explain why (LEDCs).	deforestation	occurs	in	some	less	economically	developed	countries
(iv)		soil changes af							
(v)		uits, flowers ar							
	Explain why l	emurs can be o	classified	l as	both a	prim	ary and a seco	ondary cons	umer.
		•••••							[2]

(c) An area of mountainous rainforest covering 32000 hectares has been set up as a wildlife reserve to protect 12 different species of lemur. Some tourists visit the wildlife reserve after a long journey over a rough track. There is a small visitor centre. If tourists stay overnight they have to sleep in a tent and bring their own food.

The following activities also take place in the reserve:

- plant and animal populations are surveyed by scientists
- trees are replanted by local people
- methods of sustainable farming are taught to local people
- fuel-efficient cooking stoves are promoted.

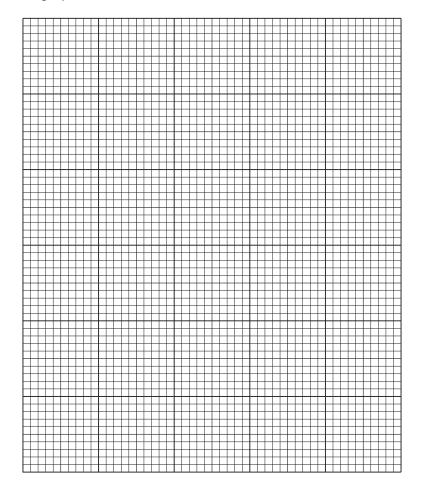

(i)	Explain why surveys of plant and animal populations need to be done regularly.	
		[2]
(ii)	Describe three different methods of sustainable farming.	
	1	
	2	
	3	
		[3]

(d) Fuel-efficient cooking stoves reduce emissions of carbon dioxide.

The table shows the estimated sales of fuel-efficient cooking stoves over a 7-year period for one region of Madagascar.

year	estimated sales of fuel-efficient cooking stoves / thousands
1	2.0
2	5.5
3	11.0
4	18.0
5	26.5
6	36.0
7	45.0

(i) Plot a line graph of the data.

[4]

(ii)	Use your graph to predict the estimated sales of fuel-efficient cooking stoves in year	8.
		[1]
(iii)	Suggest two advantages to local people who live in rural areas of using fuel-effic cooking stoves.	ient
	1	
	2	
		[2]

(e) There are about 800 different species of orchid plant found only in Madagascar.

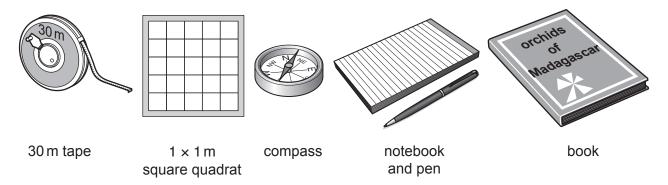

(i)	Explain why an orchid plant is classified as a producer.	
` '		
	[1	11

(ii) This orchid species is under threat from people collecting plants illegally.

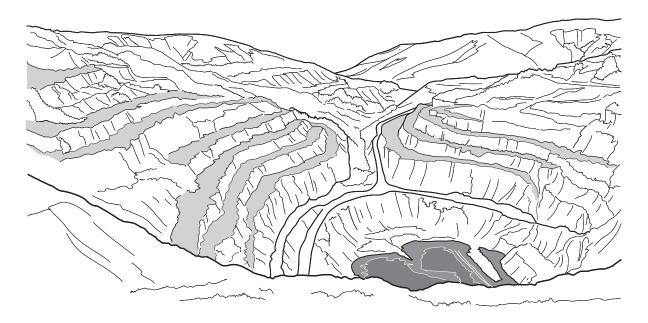

A scientist decided to monitor the population of this orchid species to find out if any of three locations along a path had been visited by people collecting plants illegally.

The diagram shows the scientist's equipment.

Describe a method the scientist could use to monitor the population of this orchid species using the equipment shown in the diagram.
[6]

2 (a) The drawing shows a disused chromite mine near the port of Toamasina.

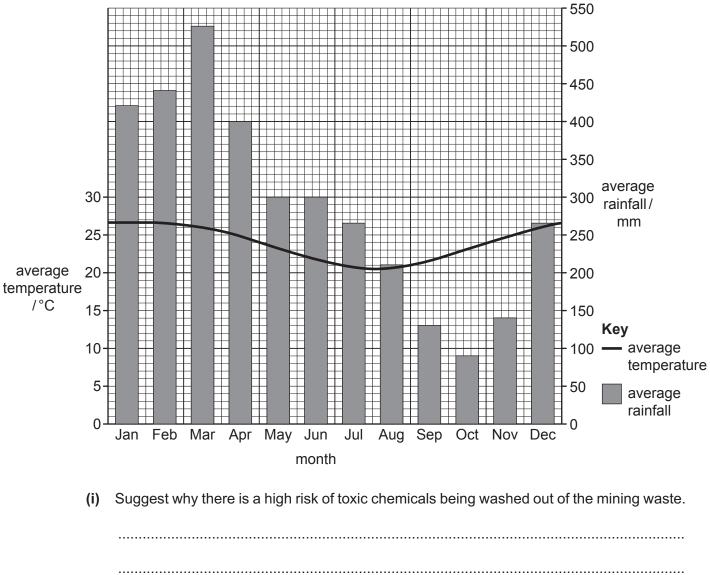

The disused chromite mine was reopened in 2009.

(i)	Identify the type of mine shown in the drawing.	
		[1]
(ii)	Suggest two benefits of mining in this way. 1	
	2	
		 [2]
(iii)	The chromite is being mined from igneous rock.	
	Explain how igneous rock is formed.	

(iv)	The ore is processed at the mine to increase the concentration of chromite in the crust ore. The crushed ore is taken to the port of Toamasina for export.	hed
	Suggest one reason why the ore is processed at the mine.	
		[1]
(v)	A mining company has a permit to explore and then mine an area of 2000 km ² .	
	Describe the environmental impacts of starting a new mine.	
		[3]
(vi)	Describe two economic impacts of mining.	
	1	
	2	
		[2]

(b)	Chromite is exported to other countries. Most chromite is used in the manufacture of stainless steel.									
		2010 the world price of chromite reached 3000 USD per tonne. By 2012 the price haven to 2000 USD per tonne.	ad							
	(i)	Calculate the percentage decrease in the world price of chromite per tonne from 2010 2012.	to							
		% [2]							
	(ii)	Suggest two reasons why the world price of chromite decreased.								
		1								
		2								
		l	[2]							
	(iii)	Describe ways chromite can be used sustainably.								
		[3]							

(c) The graph shows climate data from a weather station near the chromite mine.

	[2]	
(ii)	Some toxic chemicals can bioaccumulate in the environment.	
	Describe the process of bioaccumulation.	
	[0]	

(d) There is a lake near the chromite mine.

A local fisherman said,

I used to catch lots of large fish.
I only catch a few large fish now, mainly I catch small fish.

(i)	Suggest why there are only a few large fish to catch.	
(ii)	Describe possible changes in the food chain that could explain why local fisher mainly catch small fish.	-
(iii)	Do you think fishing in this lake is a sustainable activity? Explain your point of view.	. [2

(e) The photograph shows the lake near the chromite mine.

water hyacinth plants

Water hyacinth plants grow rapidly and cover large areas of the lake.

Two fishermen were talking about the lake.

We have to remove water hyacinth plants every year so we can get our boats to the fishing area.

Now the chromite mine has started working again we have to spend more time removing water hyacinth plants.

Suggest one local people.	•	ater hyacinth	n plants tha	at are remo	oved from t	the lake co	ould be use	d by
								[1]

(f) A student wanted to find out if toxic chemicals from the mining waste increase the number of water hyacinth plants.

The following method was used:

- six large pots were labelled A to F
- each pot was filled with water containing a different concentration of toxic chemicals
- 60 small water hyacinth plants of the same size were collected from an unpolluted lake
- 10 of these plants were placed in each pot
- the number of living plants in each pot was recorded after 14 days.

The results are shown in the table.

	pot							
	A B C D E F							
concentration of toxic chemicals/ppm*	0.0	0.5	0.75	1.0	2.0	5.0		
number of plants at the start	10	10	10	10	10	10		
number of plants after 14 days	20	23	27	17	15	13		
increase in number of plants								

*ppm			

(i)	Complete the table to show the increase in the number of plants in each pot.	[1]
(ii)	Explain why the student included pot A in their method.	
		[1]
(iii)	State two factors the student should keep the same over the 14 days of the experime	nt.
	1	
	2	
		[2]

(iv) Describe the pattern shown b	y the resu	lts.			
The student decided to take sam	anles of w	rator from	tho lako u	ead by th	o fishorma
samples were taken from five diffe					e iisnerme
The student then repeated the exp					a lake
·		Sing the wa	ater sampli		a lake.
The results are shown in the table	•				
		location	n of water	sample	
	Р	Q	R	S	Т
umber of plants at the start	10	10	10	10	10
umber of plants after 14 days	26	17	12	20	22
The student decided that water sa chemicals. Explain why the student came to the student decided that water sa chemicals.	mple R wa	s likely to h			
, ,					

(h) The graph shows climate data from a weather station near the chromite mine and lake.

Using information f throughout the year.	_	aph explair	n why the	rate of	evaporation	will be	high
